

# Gardening for Pollinators

# Meet Our Pollinators

- Pollination is the transfer of pollen, or male gametes, from one flower to another.
- Between 60% and 80% of flowering plants require an animal to effectively reproduce.

# V.I.P.s = Very Important Pollinators

There are roughly **200,000** species belonging to four insect groups that pollinate flowers; this comprises 20% of all known insect species.

● Bees & other Hymenopterans	47%
● Flies	26%
● Beetles	15%
● Butterflies & Moths	10%
● Others	2%

- Loss of habitat
- Pesticides and herbicides
- Pollutants
- Invasive species

## 4 threats to Pollinators...and one bright spot

# Honeybees – The Ultimate Pollinator

- Large social colonies
- Overlapping generations
- Division of labor

# Native Bees

# Flies

- Shorter tongues
- Some attracted by foul odors, dull colors
- Need moist sites for egg-laying

# Beetles

- Pollen eaters, chewing mouthparts
- Like to “date and mate”
- Lay eggs in decaying wood

# Butterflies and Moths

Colorful, fragrant, nectar-rich flowers + host plants

Pale, fragrant flowers (if any) + host plants

## Hummingbirds

- Rufous and Broad-tailed are most common here
- Sense of smell less important
- Tubular, red or purple flowers
- Roosting spaces at night

# Pollinator Vision

## Visible Light Region of the Electromagnetic Spectrum

# Pollinator Mouthparts

Long and slender

Short and substantial

## Pollinators need:

- Food
- Water
- Space to raise young
- Protection

# Habitat for Pollinators

- Different pollinators have different nesting requirements.

# Habitat Design

Habitat gardens maximize foraging area, especially near nesting sites.

- Clumps and layers
- Groundcovers and windbreaks

# Plant Choice – Diverse and Constant

- Extend your growing season.
- Different sizes, shapes and colors attract different pollinators.

# Habitat Garden Maintenance

- Avoid pesticides.
- Focus on the important chores.
  - Deadheading!
- Monitor your garden on a regular basis.

Thank You!
